OBJECTIVE

To leverage my full-stack engineering experience across Java / Spring Boot microservices and modern React front ends — together with hands-on Docker, Git-based CI/CD and Linux deployment practice — to design, ship and operate secure, high-throughput platforms end to end, and to grow into a role where I own service design, automation and reliability within an enterprise engineering team.

PROFESSIONAL SUMMARY

Full Stack and DevOps Engineer with 1.2 years of total IT experience, building and operating a banking-operations platform end to end — Java 17 / Spring Boot 3.5 microservices that validate high-volume financial payment transactions, the React 18 micro-frontend suite that operators work in, and the Docker, CI/CD and Linux deployment chain that ships both. Comfortable owning a feature from domain modelling and API design through UI, testing, containerisation, release and production support, working directly with product, QA and business stakeholders in an Agile delivery model.

Highly proficient in RESTful API design and consumption (40+ controllers), event-driven processing with Apache Kafka and Kafka Streams, real-time delivery over Server-Sent Events and WebSocket/STOMP, in-memory caching with Redis, and PostgreSQL data modelling using Spring Data JPA, native upsert SQL and JSONB. Strong in core Java — OOP, collections, generics, enums, functional interfaces and java.util.concurrent multithreading — and in clean-code practice (SOLID, DRY, constructor injection, MapStruct DTO mapping) backed by JUnit and Mockito test coverage.

Practical DevOps exposure across the full delivery chain: AWS infrastructure — EC2, VPC with public and private subnets, Internet and NAT Gateways, IAM users, roles and policies, and security groups; container orchestration on Kubernetes with Helm charts, ConfigMaps / Secrets and rolling updates; Docker and Docker Compose for reproducible local infrastructure (Kafka in KRaft mode, Redis, PostgreSQL); configuration management with Ansible using role-based playbooks to provision environments and install / upgrade packages; Git branching, tagging and release workflow with Maven builds and Docker-based CI/CD pipelines; and log-driven troubleshooting and performance debugging with SLF4J/Logback.

On the front end, builds production React 18 interfaces at platform scale: a Webpack 5 Module Federation architecture of a shell host plus six independently deployable remotes, real-time dashboards bound to Server-Sent Event and WebSocket streams, cross-application communication over a browser event bus, a shared design-token theming system, and role-driven navigation. Also experienced in Python backends (FastAPI, Flask) and React Native, and in supporting build, release and production operations for Java microservices deployed on AWS EKS.

EMPLOYMENT HISTORY

- Working as Software Engineer – Full Stack & DevOps in Fisec Global, Hyderabad from Jul 2025 to till date.

DETAILED PROFESSIONAL SUMMARY

- 1.2 years of total IT experience.
- 1 year 2 months of hands-on full-stack and DevOps experience at Fisec Global, covering Java / Spring Boot microservices, React 18 front ends and the build, containerisation and deployment chain that ships them.
- Practiced Agile methodology for the software development process.
- Built and maintained Spring Boot 3.5 / Java 17 microservices that validate payment transactions through a multi-stage pipeline (message-ID → BIC → business rules → fraud → persistence).
- Designed and implemented RESTful APIs across 40+ controllers and consumed external web services (fraud-detection, BIC-suggestion and rule-matcher APIs) for secure, reliable data exchange.
- Engineered a custom rule engine using Data Structures & Algorithms — predicates compiled into a DAG / decision tree and traversed at runtime — applying OOP, generics, enums and functional interfaces (Predicate, Consumer).
- Implemented event-driven processing with Apache Kafka and Kafka Streams, and real-time updates to operations dashboards via Server-Sent Events and WebSocket/STOMP.
- Added Redis in-memory caching for BIC-directory and rule-alias lookups, eliminating per-transaction database hits and improving throughput.
- Applied multithreading and `java.util.concurrent` — `ThreadPoolTaskExecutor` with `@Async` database writes, `AtomicReference` and `CopyOnWriteArrayList` — for safe, non-blocking concurrency.
- Worked with PostgreSQL using Spring Data JPA, native upsert SQL and JSONB columns, and built an ISO 20022 pacs.008 maker-checker approval workflow integrating with external systems.
- Wrote JUnit and Mockito tests on an H2 in-memory profile; used SLF4J/Logback logging and SonarQube-style clean-code practices (SOLID, DRY, constructor injection, MapStruct DTO mapping).
- Experience with SCM tools like Git / GitHub for branching, tagging and version management.
- Experience of CI (Continuous Integration) and CD (Continuous Deployment) methodologies with Git, GitHub, Maven and Docker-based pipelines.
- Used Docker and Docker Compose to stand up reproducible local infrastructure (Kafka in KRaft mode, Redis, PostgreSQL) so the whole team runs an identical environment with a single command.
- Worked on AWS services such as EC2, VPC, IAM, Security Groups, Internet Gateway / NAT Gateway, EBS, S3 and Elastic Load Balancer for hosting and infrastructure management.
- Created on-demand infrastructure on AWS — launching and sizing EC2 instances, and building a VPC with public and private subnets, route tables, an Internet Gateway and a NAT Gateway so that private workloads reach the internet without being publicly exposed.
- Created and managed IAM users, groups, roles and least-privilege policies, along with security groups controlling access to the application, database and cache tiers.
- Deployed containerised applications to Kubernetes using Helm charts and plain manifests (Deployments, Services, Ingress), with ConfigMaps and Secrets for configuration, readiness / liveness probes, and rolling updates and rollbacks.
- Worked on the configuration management tool Ansible for bringing up environments with the necessary dependencies, by writing role-based playbooks for different environments such as dev, test and production.
- Used Ansible playbooks to automate installation and upgrade of software packages and service dependencies (Java / OpenJDK, Python runtime, Redis, Kafka, Nginx) on Linux hosts, replacing repetitive manual setup steps.
- Used Maven as the software build and package-management tool, with profile-based configuration for dev, test and production environments.
- Deployed Spring Boot services and React production bundles onto Linux (Ubuntu) hosts served behind Nginx / Express static servers, and supported those environments post-deployment.
- Experience in writing shell and Python scripts for automating manual tasks.

- Experience in troubleshooting build, deployment and container issues, and in debugging performance problems from application logs.
- Built React 18 front ends on a Webpack 5 Module Federation micro-frontend architecture — a shell host plus six independently built and deployed remotes, each shippable without redeploying the whole product.
- Developed real-time operator dashboards in React bound to Server-Sent Event and WebSocket streams, with cross-application communication over a browser CustomEvent bus and a shared design-token theming system.
- Implemented front-end authentication, session handling and role-filtered navigation (MAKER / CHECKER / ADMIN) against the Spring Boot auth API.
- Deployed Java-based applications and microservices on AWS EKS using Kubernetes and Helm charts, and managed CI/CD pipelines with Jenkins, Git, SonarQube, Maven and JFrog.
- Used ELK and Kibana for centralized logging, application monitoring and production issue analysis, and prepared RCA documentation for recurring incidents.
- Have the ability to understand and transform complex business requirements into software, ensuring applications are delivered on time, to specification, and are scalable and maintainable.
- Excellent code debugging skills.
- Working experience with different stakeholders within the organization and with client-facing teams.

EDUCATION

- B.Tech in Information Technology from Vignana Bharathi Institute of Technology, Hyderabad (2022 – 2025) — CGPA 7.65 / 10.
- Diploma in Civil Engineering from Kshatriya College of Engineering (2019 – 2022) — GPA 7.48 / 10.

SKILLS SUMMARY

Programming Languages	Java 17 (8 / 11+), JavaScript (ES6+), Python, SQL, Shell scripting
Frontend	React 18, Webpack 5 Module Federation (micro-frontends), React Native, HTML5 / CSS3, responsive UI, real-time dashboards (SSE / WebSocket)
Backend Frameworks	Spring, Spring Boot 3.x, Spring Data JPA, Spring Kafka, Spring WebSocket, Hibernate, MapStruct, Lombok, FastAPI, Flask, Node.js / Express
Core Java	OOP, Collections, Generics, Enums, Annotations, Exception Handling, Serialization / Deserialization, Immutability, Autoboxing, Multithreading & java.util.concurrent
APIs & Messaging	RESTful web services (design & consumption), Apache Kafka & Kafka Streams, Server-Sent Events, WebSocket / STOMP, ISO 20022 (pacs.008), Swagger / OpenAPI
Databases	PostgreSQL (RDBMS, SQL, JSONB), MongoDB (NoSQL), Redis (in-memory cache), H2, Firebase
Cloud Environment	AWS — EC2, VPC (public / private subnets, route tables), Internet Gateway & NAT Gateway, IAM (users, groups, roles, policies), Security Groups, EBS, S3, Elastic Load Balancer
Containerization	Docker, Docker Compose, container troubleshooting
Container Orchestration	Kubernetes (Deployments, Services, Ingress, ConfigMaps / Secrets, probes, rolling updates), Helm charts
Infrastructure as Code	Terraform (infrastructure provisioning and management)

Configuration Management	Ansible — role-based playbooks, environment provisioning, automated application deployment, package install / upgrade automation
CI / CD and Build tools	Jenkins, Git, GitHub, GitHub Actions, Maven, SonarQube, JFrog Artifactory, Docker-based CI/CD pipelines, branching / tagging / release workflow
Artifact / Image management	JFrog Artifactory, Docker registry
Infrastructure & Deployment	AWS + UNIX / Linux (Ubuntu) host deployment, environment / profile-based configuration, externalised config, cloud-ready application design, Firebase, Hugging Face Spaces
Application / Web servers	Apache Tomcat (embedded), Nginx, Express static server
Logging and Monitoring	ELK Stack (Elasticsearch, Logstash, Kibana), SLF4J / Logback, structured application logging, log-based root-cause analysis, RCA documentation
Version Control Tools	Git / GitHub / Bitbucket
Testing & Quality	JUnit, Mockito, H2 integration tests, SonarQube code quality, SOLID & DRY principles, peer code reviews
Operating Systems	UNIX / Linux (Ubuntu / CentOS), Windows
Defect tracking & PM tools	Jira, GitHub Issues, Agile / Scrum ceremonies
AI-assisted development	Claude CLI and AI-assisted tooling for application programming, troubleshooting, Terraform and Helm configuration authoring
IDEs & Developer tools	IntelliJ IDEA, VS Code, Postman, pgAdmin, DBeaver

PROJECTS

Project #1:

Title: QDL

Client: FISEC Global

Organization: FISEC Global

Role: Full-Stack & DevOps Engineer

Technologies: UNIX, AWS, Kubernetes, Helm, Terraform, Ansible, Jenkins, Git, SonarQube, Maven, JFrog, Java, Spring Boot, ELK, React, Claude CLI

Team Size: 7

Description: Quantum Data Leap (QDL) is an AI-powered decision intelligence platform designed to help organizations transform complex financial and operational data into clear, actionable insights.

Roles & Responsibility:

As a Full-Stack & DevOps Engineer:

- Worked on application development and maintenance using **Java/Spring Boot, React, and Microservices**.
- Handled application build and deployment across QA, UAT, E2E, Staging, and Production environments.
- Created and maintained **Helm charts** for Kubernetes-based application deployments.
- Deployed and managed applications on **Kubernetes** environments.
- Managed CI/CD pipelines using **Jenkins, Git, SonarQube, Maven, and JFrog**.
- Used **Terraform** to provision and manage application infrastructure and supported infrastructure configuration with Ansible.

- Worked with AWS services for application infrastructure, deployment, storage, IAM, and environment management.
- Used **ELK and Kibana** for centralized logging, application monitoring, troubleshooting, and production issue analysis.
- Used **Claude CLI and AI-assisted development tools** to support application programming, troubleshooting, infrastructure configuration, and deployment activities.
- Worked with Claude CLI to assist in creating and improving **Terraform infrastructure configurations and Helm-based deployment configurations**.
- Troubleshot application, deployment, infrastructure, and production issues and prepared RCA documentation.

Project #2:

Title: Willingly — Donation & NGO Fundraising Platform

Client: FISEC Global

Organization: FISEC Global

Role: DevOps Engineer

Technologies: UNIX, AWS, Kubernetes, Helm, Ansible, Jenkins, Git, SonarQube, Maven, JFrog, Java, ELK, Spring Boot, Microservices

Team Size: 6

Description: Willingly is a donation and NGO fundraising platform that enables NGOs to create fundraising campaigns and allows donors to contribute and track their donations.

Roles & Responsibility:

As a DevOps Engineer:

- Handled application build and deployment activities across QA, UAT, Staging, and Production environments.
- Deployed Java-based applications and microservices on **AWS EKS using Kubernetes and Helm charts**.
- Created and maintained **Helm charts** for application deployment and configuration on EKS.
- Managed CI/CD pipelines using **Jenkins, Git, SonarQube, Maven, and JFrog**.
- Handled deployment of **Windows-based applications on on-premises servers** using Ansible playbooks.
- Developed and maintained **Ansible playbooks** for automated application deployment and server configuration.
- Supported AWS infrastructure and EKS environment management for application deployments.
- Monitored application health, performance, and logs using **ELK and Kibana** monitoring tools.
- Troubleshot deployment, application, server, and environment-related issues.
- Supported production incidents and prepared RCA documentation for recurring issues.

CERTIFICATIONS

- Model Context Protocol (MCP) — Anthropic.
- Wipro TalentNext — Java Full Stack.
- J.P. Morgan Software Engineering Virtual Experience — Forage.
- Introduction to MongoDB — MongoDB University.
